

UniFind

Presented by NexusDevs

Problem Statement

Students after completing class 12th, struggle to find the college that best aligns with their academic performance, interests, and future goals.

Solution

Create a web application that streamlines the college selection process. Students can input their 12th percentage, JEE scores, and preferred stream, and our algorithm will generate college recommendations based on the user input. The platform will consider factors like college rankings, placement records, and student reviews for a comprehensive analysis.

Tech Stack

Backend

BeautifulSoup4 – For scraping all colleges' cutoff data

Supabase – For the database and BaaS provider

NodeJS – Javascript runtime library

Frontend

NextJS – Frontend framework

ShadcnUI – Component library

TailwindCSS – CSS framework

**Thank you
very much!**
